

Abstract of the disclosure

The Trailer Alignment Bracket (TAB) system is a new concept to aligning any type of trailer. The TAB brackets are made with 3/8 inch to 5/8 inch steel, using Grade 10 bolts. The TAB system consist of 3 different specially designed brackets fitting on trailer framer in front, middle and rear of axles. The Brackets are made to be adjustable so that the original spring brackets welded stationary to frame at assembly point, are removed and TAB is installed after measuring mis-alignment. When trailer is re-assembled, again the alignment is checked for correct settings using computerized lazer equipment. This system does provide positive tire performance, saves fuel and adds a very positive element in entire towing operation.
